

ABSTRACT OF THE DISCLOSURE

A braid folding unit of a shielded wire is provided, which includes: a primary expanding means to beat a braid 22 exposed on an inner cover 24 of the shielded wire 15 so as to outwardly expand the braid; an expanding pipe 135 to enter an inside of the braid 22 along the inner cover so as to further outwardly expand the braid; and a braid folding member 137 to advance along an outside surface of the expanding pipe so as to push the braid 22 in an axial direction of the shielded wire and to fold back the braid. The primary expanding means has a pair of openable-
and-closable expanding teeth 134, a pair of sliding members fixing the respective expanding teeth, and a driving means to open and close the pair of sliding members in opposite directions.
